The article presents a third-generation technology of solar cells called dye-sensitized solar cell (DSSC), enhancing cell efficiency through material improvements.

Chrysanthemums, in their natural habitat, thrive in full sun, typically requiring at least six hours of direct sunlight per day to produce abundant blooms. Sunlight fuels photosynthesis, the ...

However, growing these flowers requires significant energy, as growers must provide 8-10 hours of artificial light each night to ensure proper stem elongation and flower development.

Many flower farms are now incorporating renewables like solar energy systems to power their operations which significantly reduces carbon emissions and dependence on fossil fuels.

Energy Resilience: Solar energy provides a reliable and consistent power source, even in remote areas, ensuring our crops have a stable and sustainable energy supply.

In this work, three different dyes from Chrysanthemum flower petals were used to investigate the organic sensitization of solar cells. The presence of anthocyanin molecules in the ...

Additionally, these flowers attract vital pollinators, thus enhancing biodiversity within solar-powered landscapes. The long blooming season from summer to frost enables these flowers to ...

The project started in 2017 and is currently investigating whether or not it's possible to achieve high-quality chrysanthemum production with lower energy consumption. One aspect the ...
