Can a flat PV system fit more solar panels?

US-based energy technology developer, Erthos, is a clear example of a company investing heavily in flat PV panels. They have obtained a patent for an 'Earth Mount Solar PV system' which the company says can fit more panels into a space than conventional utility-scale plants. So are these companies on to something interesting?

Why do solar panels need to be laid flat?

When laid flat, they don't capture as much sunlight as panels on a sloped roof or pitched roofs. This can result in less electricity generated throughout the day, especially in areas where the sun's angle changes significantly. Adjusting the panel's angle can improve how solar panels work by maximizing sunlight exposure.

Should solar panels be installed flat or sloped?

In fact, flat roof installations often outperform sloped roof systems when properly designed and installed. The key is understanding that panels should never be installed completely flat against the roof surface. Solar panels require a minimum tilt angle of 10 degrees to function optimally and maintain manufacturer warranties.

Are flat solar panels right for Your House?

You don't need structures with an angle for support. Homes or buildings having roofs that are flat, or those who want a more uncomplicated process of installation, find these panels to be perfect. Easy Installation: One of the biggest benefits of flat solar panels is they can mix perfectly with your roof.

The angle at which solar panels are mounted can significantly influence how much sunlight they capture, thereby impacting overall energy production. This guide explores the ...
