Hydrogen in Kazakhstan is stalling. Why pilot projects fail to reach the market, where the economics break down, and what blocks investment.

This review extensively discusses Kazakhstan's main energy resources, the potential for low-carbon and green hydrogen production, existing and prospective pilot projects in the field of hydrogen, as ...

In addition to domestic demand within Kazakhstan, there is also potential to satisfy demand for hydrogen outside of Kazakhstan. Hydrogen could be used in the production of methanol and ammonia for use ...

Furthermore, Kazakhstan also holds a large potential of renewable energy sources (mainly solar and wind but also hydroelectric) which could allow to start production of green hydrogen, a complete ...

Abundant renewable energy potential: Kazakhstan's vast wind and solar resources, combined with its available land, create favourable conditions for large-scale green hydrogen production.

The prospects of hydrogen energy in Kazakhstan are mainly seen from an export-oriented perspective. There has been limited progress toward developing hydrogen-end use in Kazakhstan. ...

By integrating hydrogen into industries, transportation, and energy systems, Kazakhstan seeks to decarbonise its economy, diversify its energy mix, and achieve carbon neutrality by 2060.

The modelling results of regional energy systems show the potential of KZ to become a major player in the emerging hydrogen market, especially in the context of the enhanced energy connectivity ...
