Significant studies have been conducted on photovoltaic supports, resulting in numerous practical and actionable insights. However, the primary focus of the research is on the distribution of wind pressure ...

A modal analysis of the flexible PV support structure is conducted under three different cable tension levels (40 kN, 80 kN, and 100 kN), and the results are summarized in Table 5.

In this study, the wind-induced vibration characteristics and the suppression measures of a 35-meter-span cable-truss support photovoltaic module system array are studied. Firstly, based on ...

However, the primary focus of the research is on the distribution of wind pressure on photovoltaic module surfaces and the characteristics of wind loading.

The main objective of this paper is to provide a comprehensive review on the state-of-the-art studies focusing on the aerodynamic characteristics and wind-induced response of flexible PV ...

Their work provides theoretical support and practical guidance for the wind-resistant design of photovoltaic structures.

These flexible PV supports, characterized by their heightened sensitivity to wind loading, necessitate a thorough analysis of their static and dynamic responses.

In this paper, we mainly consider the parametric analysis of the disturbance of the flexible photovoltaic (PV) support structure under two kinds of wind loads, namely, mean ...
