Does Spain need a Bess energy system?

Currently, Spain has 6.3GW of hydroelectric and 1GW of thermal storage capacity installed. In fact, the non-BESS storage capacity in Spain is higher than in any other European country. As a result, the need for BESS to integrate renewable energy sources into the electricity system is less immediate than in the UK, for example.

How many Bess projects are there in Spain?

In March 2025, UK companies Renewco and Atlantica announced the development of up to 2.2GW of BESS projects across Spain. Other projects in the pipeline primarily involve storage co-located with solar or wind generation. According to BloombergNEF, the total capacity currently in the BESS pipeline is around 3GW.

Why is Bess less urgent in Spain?

Another reason the integration of BESS is less urgent in Spain is the high resilience of the Spanish grid, despite its low level of interconnection. The Spanish TSO operates a very solid matrix-design grid, which includes a system for technical restrictions centrally operated in the Renewable Energy Control Centre (CECRE).

What is a Bess project?

BESS are becoming a key component of the European electricity system, providing much-needed flexibility by storing surplus renewable energy and supplying it during peak demand. However, market conditions for BESS projects vary across countries and continuously change with the progression of the energy transition.

With an impressive project pipeline and strong regulatory support for battery development, Spain is on track to become a leading BESS market by 2030.

In April 2025, Spain's installed BESS capacity is only 60MW, whereas the UK and Italy already have 5.6GW and 1GW of online BESS capacity, respectively. In this article, we discuss the latest ...
