As veteran engineer Zhang Wei puts it: “Designing mine storage is like teaching an old dog quantum physics - you need to work with existing structures while pushing technological boundaries.”

These techniques, which include compressed air energy storage (CAES), pump hydro storage (PHS), and others, can potentially offer substantial solutions to energy storage needs, ...

Therefore, this paper mainly discusses the research status of using coal mine underground space for energy storage, focusing on the analysis and discussion of different energy types of ...

From capturing sunlight in vast expanses of open-pit mines, to optimising energy production through compressed air storage in underground mines, these innovations hold the key to ...

In this paper, four mining levels in a closed coal mine in the Asturian Central Coal Basin (NW Spain) have been selected as a case study to investigate the technical feasibility of ...

Underground pumped storage development is being seen as a way to utilise abandoned coal mines and coordinate the development of clean energy in high-potential communities.

In the context of sustainable development, revitalising the coal sector is a key challenge. This article examines how five innovative technologies can transform abandoned or in-use coal mines into ...

You know, traditional mines consume 4-7% of global electricity while operating, but what happens when they close? Most tunnels get sealed, creating artificial caves perfect for thermal stability.
