What is a solar photovoltaic power plant?

A solar photovoltaic (PV) power plant is an innovative energy solution that converts sunlight into electricity using the photovoltaic effect. This process occurs when photons from sunlight strike a material, typically silicon, and displace electrons, generating a direct current (DC).

What are the different types of solar power plants?

Depending on its operating system, there are two main types of solar plants: solar thermal power plants and solar photovoltaic plants. Although both solar thermal plants and photovoltaic power plants use solar energy to produce electricity, the process to generate it is different in each case.

What are the two types of large-scale solar power plants?

Following are the two types of large-scale solar power plants: Concentrated solar power plants (CSP) or Solar thermal power plants. The process of converting light (photons) into electricity (voltage) is known as the solar photovoltaic (PV) effect. Photovoltaic solar energy cells convert sunlight into solar energy (electricity).

What are some examples of solar photovoltaic power plants?

In addition to conventional solar plants, photovoltaic systems installed on the roofs of buildings known as solar communities, which generate electricity for self-consumption and reduce energy costs, or solar farms, are two great examples of solar photovoltaic power plants. At Repsol, we have several photovoltaic projects:
