If it is necessary to store the equipment before installation, prepare a suitable storage space. Place the equipment on a true and level surface in order to reduce strain and distortion in the equipment.

For ac control, a capacitor trip device is used with each circuit breaker shunt trip to ensure that energy will be available for tripping during fault conditions.

In the charged state, the closing spring holds energy, ready to close the breaker. In the discharged state, the spring needs recharging before the breaker can work again.

CATV passives and actives are far more sensitive to surges than electrical wiring. 6KV protection for RF applications is very limited and should not be relied on to protect CATV actives or passives.

When a circuit breaker operates normally, the spring is wound into a compressed state when the handle or mechanism is reset. This compression stores energy, allowing greater efficiency ...

In the case of fully sealed vacuum circuit breakers, manufacturers do not normally recommend examination or overhaul of the pole unit during the economic life of the installation. ...
