In this blog, we will explore the 10 most common solar panel defects from micro-cracks and hot spots to issues like delamination and PID (Potential Induced Degradation).

For instance, if a solar panel is damaged, it may still work, but will not function the same way it once did. If a solar panel experiences a big break, the whole panel will need to be replaced.

It doesn't take fist-sized balls of ice to damage solar panels, either. Hail measuring 1.75 inches or more in diameter causes massive damage to photovoltaic (PV) modules.

The back-sheet is a protective layer on the rear side of the solar panel that shields it from moisture, UV radiation, and other environmental factors. Over time, this back-sheet can deteriorate ...

Hot spots and micro-cracks are not always visible to the naked eye, and often, the only way to determine if a solar panel is compromised is to use a specialised thermal imaging camera that will highlight the ...

Solar panels connected to the grid may encounter issues with their electrical connections, often caused by loose connections or broken wiring. Left unaddressed, these problems ...

Hot spots and micro-cracks are not always visible to the naked eye, and often, the only way to determine if a solar panel is compromised is to use a specialised ...

Common solar panel defects, such as discoloration, delamination, and solar panel diode failure, often become more likely as systems age. These issues reduce overall efficiency and may ...
