The latest cost analysis from IRENA shows that renewables continued to represent the most cost-competitive source of new electricity generation in 2024.

The EIA claims that wind and solar will account for the lion's share of new generating capacity for the next decade and will provide electricity at a lower levelized cost than any traditional ...

Lazard calculates an energy resource's levelized cost, or LCOE, by dividing a project's lifetime energy production by its cost. This year's report concludes that renewables are the "most...

The global shift toward solar photovoltaic (PV) and wind power is crucial to climate mitigation, yet climate change may intensify extreme low-production (ELP) events and affect power...

But while direct costs for wind and solar are dropping, they remain expensive due in part to the backup energy sources required when renewables are not available. In short, an "affordable" ...

Annual wind and solar value has declined with increasing penetration levels. "Value factor" is the ratio between wind or solar value and an average regional metric of value based on a flat, or "always-on" ...

Lazard calculates an energy resource's levelized cost, or LCOE, by dividing a project's lifetime energy production by its cost. This ...

Uncover more realistic prices of solar and wind energy and understand the implications for the future of renewable electricity generation.
